... trends at their earliest stage."  
Virtual reality creates the illusion of being immersed in an **artificial world**, or of being present in a **remote** location in the physical world. For state-of-the-art **VR**, one must be able to move around in a computer-generated environment and interact with it. This new world is known as '**cyberspace**', a term coined by science-fiction writer William Gibson in his novel Neuromancer, in which the journey into **cyberspace** is imagined as a globally-lined, computer-borne, 'consensual hallucination'. To enter **cyberspace**, a person needs three pieces of equipment: a **head-mounted display (HMD)**, which is made up from two miniature television screens mounted in a **headset**, which provides the wearer with a three-dimensional view of an imaginary world; a glove...  
...world; and a set of computers calculating the space coordinates for each particle of the **virtual world**, at about 32 million commands per second. If the **HMD** and gloves are linked not to a computer model but to a robot that has two eyes, located as far **apart** from one another as human eyes, a neck which can move like a human neck, ears containing microphones and a hand-like gripping device, the system is known as a **teleoperator** or **telerobotic** system. Virtual reality took off in 1983 at a meeting of people who use personal...

...play 'air guitar' in which by wearing a glove hooked up to a synthesizer, the **user** could create a series of notes by stroking the air. They joined up forces and...

...three dimensional computer graphic models. VPL also started working on a commercial version of the **HMD**, which made it possible for people to be totally immersed in a **virtual world**, eliminating the separation between human and computer.

VPL was the first company to take a...

... respectively," Kobayashi said.

The NTT system, which the team calls a "real-scale interface for **cyberspace**," uses a stereographic head-mounted display (HMD) for video input. A bidirectional interface between the HMD and graphics computer lets the **user**'s perspective on the **virtual environment** change to match his head movements. This creates "an immersive **cyberspace** where **users** can have a natural sense of space and can communicate with others in a natural way," according to Kobayashi. With CRT-and-mouse interfaces, by contrast, "**users** have to stand **apart** from the others to view all the participants in the conversation . . . and tend to feel...

...applications created using Superscape VRT.

In addition to marketing Superscape's software, IBM will sell **VR** - related services such as consultancy, **virtual world** building and training. Working in partnership with IBM, Superscape will be responsible for providing the majority of these services. Last month, Superscape launched VisNet, a **VRML** -based program for viewing and exploring the **Internet** in 3D without a **head - mounted display**. Aimed at PC users who have created **virtual worlds** using Superscape VRT, VisNet is distributed free over the **Internet** and is claimed to be 5-10 times faster than current 3D viewers.

Superscape is...

... to send real-time speech to the participants, with no perceptible delay,' said Drakard.

The Net also looks set to use more VR as processors become more powerful and are able to create 3D worlds from a simple set of instructions. A language for sending VR worlds over the Net already exists, called Virtual Reality Markup Language (VRML). Most browsers come with VRML built in, but it is rarely used. Even with VRML helping to cut down the data to be sent, the average user will not tolerate the download times needed. Several companies have experimented with VRML chat systems, where users send their virtual character, known as an avatar, into a room to interact with other users. However, these systems are largely screen-based because very few users have access to headsets.

Elsewhere in the VR industry, the Seattle-based Microvision has made one of the biggest...

Motorola's Hot New Wireless Data Interface? Voice.  
Wireless Insider

TEXT:

...Motorola aired to introduce its new voice-driven "cyber-assistant,"  
named  
Mya.  
Wanting to give **users** "a personal connection within the **virtual world**  
,"  
Motorola went overboard with the idea of Mya as character.  
Apparently they learned from the...

...Arriving at the show by limo, Mya was sleek, she was sexy, she had a  
**headset**  
mike, she flirted shamelessly with the camera and she gave off a faint  
bluish  
glow...

...of these to have an animated persona, Mya is the  
first to focus primarily on **Internet** content instead of on telephony or  
voice  
mail.  
Using what Motorola for some reason chose...

...over any phone, landline or wireless, but clearly this is a  
service aimed at mobile **users** .  
For one thing, I doubt many people who have previously resisted going  
online are goingcomputers on desktops somewhere, and can read it  
themselves.  
Motorola also focuses on mobile **users** in its release, predicting that  
computers will be eclipsed as the primary **Internet** access terminal within  
two  
years by what it is pleased to call "devices formerly known...

...include the words "inexplicable cyber-ways.")  
So the target market for Mya is clearly mobile **users** who want access to  
**Internet** content while on the go.  
OK, fair enough. We all think there's going to...

...one which the company  
obviously takes very seriously--to provide a more efficient way for **users**  
to  
deal with data?  
We've always had **operators** and assistants who could read us text over the  
phone. This was inefficient, but I...

...away from meeting the kind of  
expectations that marketing departments are busily creating in the **user**  
base.  
Ultimately, Mya may have turned my head, but I want a **woman** I can talk  
to, instead of just having her read me Web pages. I'd...
